Access manager has 2 types of Access Protection

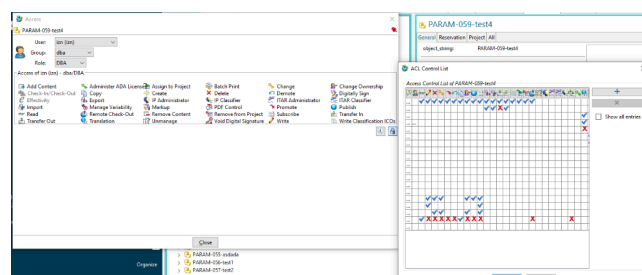

- Rule based --> Listed in the Access Manager rule tree.
- Object Based --> Right click on business object instance in TC and click Access.
- WORKFLOW Based --> Can be given in the workflow.

- To check which rules are being applied on the business object,
 - Right click --> Access --> click on Display Extra Protection button.

- To add new object based rule, click on Get Access Control List.

Login Issue in Teamcenter caused by ACL

If you face any problem for login into team center with error message "Permission access denied" after applying any ACL rule then,

Please follow the below steps to revert back changes in ACL Tree.

1. From command prompt of Teamcenter, give following command on machine where Teamcenter is working properly

```
am_install_tree -u=infodba -p=infodba -g=dba -operation=export -path=E:\acl.xml -format=xml
```

It will export the file which will have ACL tree.

Please find attached image "Import_Command.PNG".

2. Then Import this file on machine where issue is observed with following command.

```
am_install_tree -u=infodba -p=infodba -g=dba -operation=import -path=E:\acl.xml -format=xml -mode=replace_all
```

Then login into Teamcenter.

Note:

We observed this problem because we copy and paste created ACL on above "**Bypass ACL rule**", as we want to evaluate created ACL excute first. But we were not able to login in Teamcenter with any user after this. So safer side always have ACL rule after "**Bypass ACL rule**". Please find attached image "Bypass_Rule.PNG".
