

Alternate IDs

Tuesday, October 08, 2024 10:34 AM

Alternate IDs are used, when a particular user wants to use his own naming rule for a business object owned by different user.

Select a particular business object and open Alternate Id Rules tab and create a new id.

For Identifier context and Identifier Type, use new.

After creating Alternate Id, open **Identifier** Business object and under that we will be having the new Identifier and rev that we have created. Open those objects and add a naming rule to the property **idfr_id**.

Deploy the changes.

Open Teamcenter and create a instance of business object, for which Alternate Id was created.

Select that instance and open File -> New -> ID and add Alternate Name for that instance.

To check whether it is working or not. Open Tools -> Id Display Rules -> Create/Edit

Rule List: alternate id name Empty (Initial ID only)	Contexts of the selected rule: ☐ Use Default
Create Modify Remove Add Set Current Close	

Click on Create and add the object that you want to check.

Close the window and click on Set Current button to see the alternate name.
