

IRDC

Monday, August 05, 2024 5:52 PM

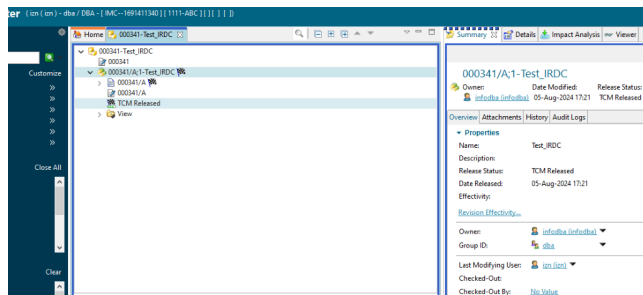

Item revision definition configuration (IRDC) is used to attach the dataset directly to a business object on the creation.

Steps to use IRDC:

1. Create a new **Document Management Template** using **infodba** and add a dataset with the named reference that you want to attach to your custom business object or creation.

2. Now release the created object and dataset, with some different user.

3. Now Go to BMIDE and create a new business object to which you want to add the dataset.
4. Create a new IRDC under Document Management and fill with appropriate data.
5. Select **Create Template** and add the Document Management object that you have created using Infodba.
