

Intelligent Part Numbering

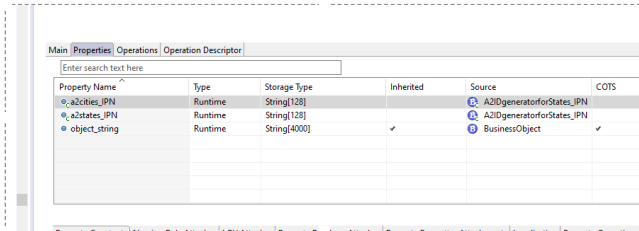

Tuesday, August 06, 2024 10:07 AM

- Currently the normal naming rule will not provide any information about the business object by seeing the Item id and object name.
- But by using IPN the user can get some extra information just by looking at the Item id and object name.

Exp: If the user selects state as TG and city as KMM then, the item id should be visible as "TGKMM-Object name"

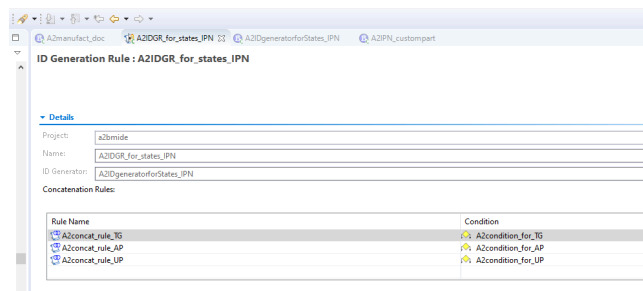

Steps to use IPN:

1. Create a New Business object under **Fnd0BaselGenerator** and add the properties that should be used for naming the business object.

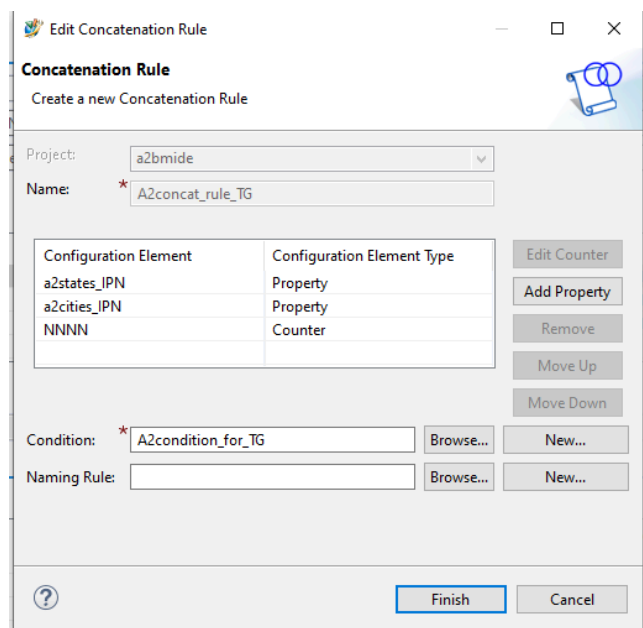

Here I want this state and cities properties to be used for IPN generation. That's why I have created those properties here and attached interdependent LOVs.

2. Under **ID Generation rule** in Extensions create a new rule and create a concatenation rule for every LOV value that you have attached.

Here in ID Generator field, give the name of the business object that you have created under Fnd0BaselGenerator.

- 3.

Add the Properties that you have created in the previous steps. And add counter if needed.

4. In the condition, add a new condition for every LOV.
