- Change manager helps to track the changes to a product throughout its life cycle.

- In the PR, one will define the problem caused by the product, then ECR will analyze the impact caused by that problem, and then the change will be implemented. All these are workflows.

Functional Perspective

Problem Report (PR)

Engineering Change Request (ECR)

Engineering Change Notice (ECN)

Examples

More like a manager.

Change Specialist

INTELIZIGN

- Determines if the change solution planning is complete.
- Update a change.
- Initiate a workflow process.
- Managing the participants of a change.

More like a developer.

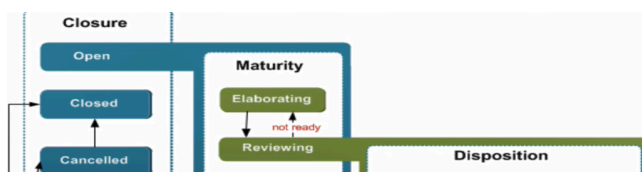

Change Analyst

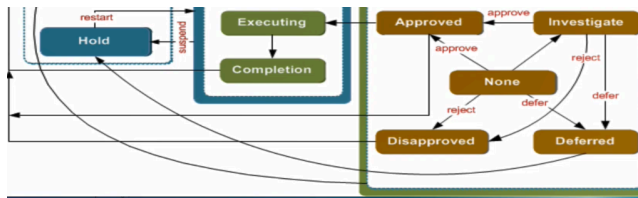

INTELIZIGN

- Analyzes the change, and proposes and updates one or more solutions that satisfy the change drivers.
- Update the enterprise change request.
- Relate change objects to other change objects.
- Managing items related to a change object Searching.

Three change object properties define these states:

- **Closure** : defines the status of the change object.
- **Maturity** : defines the degree of completion of the overall change process.
- **Disposition** : represents a technical, business, or implementation decision by a person or review board about a change object's approval.

Deferred means, they are not going to do this change in the current release, they will do that in the next release.
