

All Tasks

Wednesday, November 06, 2024 10:19 AM

Name: Graco

Tools Used: Jira and Bit Bucket

Versions: TC 13.2, VS 2017

Sprint: 21days

Utility:

1. Created a utility to read inputs from a file and create a single level BOM, based on some properties.
2. On a particular BO, it has a table property with some rows of data added in to it and we also have another secondary BO with properties same as columns of that table.

Now, client don't want the data in table format, so they asked to attach a new secondary BO for every row the table has and the values in the table must be populated at the respected property.

Finally delete all the rows.

Primary BO: Table Prop Item Revision

Secondary BO: Secondary XYZ Revision

Sol: Created a query to fetch all the instances of Primary BO and collected all the rows values using APIs and using for loops, fetched all columns data and attached secondary BO and updated those values on the secondary BO. Then removed all the rows. (ConsoleApplication2 --> ProjectTask1)

Extensions:

1. Pre-action to check before deleting a revision, whether it has any datasets or not, if there are any attach them to previous revision.
2. We have 3 custom BO, X, Y, Z.

When we create one custom BO X, Y revision and Z revision must be automatically attached to X revision and a custom release status must be added for all the revisions.

When we revise, Y or Z revision, Both Y or Z and parent revision X must be revised.

Rule Handlers:

1. Rule handler to check whether the problem items are used somewhere or not, if they are used then those parents should also be involved in the problems folder, else throw an error.

Action Handlers:

BMIDE:

1. Created Interdependent LOVs, Conditions, Naming Rules, Deep copy rules etc.
