

Task

Tuesday, October 01, 2024 10:48 AM

1. Create a workflow, so that when it is initiated on child, parent should also be involved in the workflow process.

There is a property name `ps_parents` which stores the value of `parent`.

Use **EPM-attach-related-objects** (-Property type argument).

2. Create a workflow, that will set the `object_desc` property on all the children and the parent, when initiated on parent. If the property is already set, we should neglect

Use a condition query to check the description of Item Revision and attach it to condition task and in the next task for the false path, add `-reference` argument. So that objects will be sent to references and we can set the property using **EPM-SET-PROPERTY**.
